

Introduction to Hibernate

Originals of Slides and Source Code for Examples:
<http://courses.coreservlets.com/Course-Materials/hibernate.html>

Customized Java EE Training: <http://courses.coreservlets.com/>
Servlets, JSP, Struts, JSF/MyFaces/Facelets, Ajax, GWT, Spring, Hibernate/JPA, Java 5 & 6.
Developed and taught by well-known author and developer. At public venues or onsite at *your* location.

**For live Spring & Hibernate training, see
courses at <http://courses.coreservlets.com/>.**

**Taught by the experts that brought you this tutorial.
Available at public venues, or customized versions
can be held on-site at your organization.**

- Courses developed and taught by Marty Hall
 - Java 5, Java 6, intermediate/beginning servlets/JSP, advanced servlets/JSP, Struts, JSF, Ajax, GWT, custom mix of topics
- Courses developed and taught by coreservlets.com experts (edited by Marty)
 - Spring, Hibernate/JPA, EJB3, Ruby/Rails

Contact hall@coreservlets.com for details

Topics in this Section

- Refresher in enterprise application architectures
- Traditional persistence
- Hibernate motivation
- Installation

Enterprise Application Architectures

Customized Java EE Training: <http://courses.coreservlets.com/>

Servlets, JSP, Struts, JSF/MyFaces/Facelets, Ajax, GWT, Spring, Hibernate/JPA, Java 5 & 6.

Developed and taught by well-known author and developer. At public venues or onsite at *your* location.

N-Tier Architecture

- **Application is made up of layers or tiers**
 - Each layer encapsulates specific responsibilities
 - Enables changes in one area with minimal impact to other areas of the application
- **Common tiers**
 - Presentation
 - 'View' in model-view-controller
 - Responsible for displaying data only. No business logic
 - Service
 - Responsible for business logic
 - Persistence
 - Responsible for storing/retrieving data

N-Tier Architecture

DAO Design Pattern

- **Data Access Object**
 - Abstracts CRUD (Create, Retrieve, Update, Delete) operations
- **Benefits**
 - Allows different storage implementations to be ‘plugged in’ with minimal impact to the rest of the system
 - Decouples persistence layer
 - Encourages and supports code reuse

Implementing Business Logic

- **Service Layer**
 - Thin domain layer
 - Procedural service layer
 - Fowler ‘Anemic Domain Model’
- **Domain Objects/Business Objects**
 - Thin service layer and complex OO domain model
 - Business logic primarily in the domain/business objects
 - Rich domain objects
- **Some combination of the two...**

Design Approaches

- **[D1] Service layer contains all business logic (no real domain model)**
- **[D2] Complex OO domain model/thin service layer**
- **[D3] Service layer contains use case logic that operates over thin or moderately complex domain model**

[D1] Procedural Approach

- **Service layer communicates directly to data access layer**
 - No object model
 - Data access layer returns data transfer objects (DTOs) to service layer
- **Leverages commonly understood core technologies**
 - JDBC, JavaBeans
- **Requires more low level code to persist transfer objects to the data store**

[D1] Procedural Approach

[D2] Object Oriented Approach

- **Complex OO domain model/thin service layer**
 - Rich object model utilizing standard design patterns, delegation, inheritance, etc.
 - Distinct API to domain model
- **May result in more maintainable code but updates are harder**
 - What objects have been modified and need to be saved in the database
- **Need complex Data Mapper/Data Store since domain model and database schema are likely different**
 - TopLink, JDO, Hibernate

[D2] Object Oriented Approach

[D3] Mixed Approach

- **Object model can be basic to moderately complex**
 - Simple model is just used as a data access/ORM layer
 - Model can take on business logic
 - Common behavior for different service-layer use cases
 - Service layer performs use-case operations over a set of cooperating business objects
 - Example: Entity Beans BMP/CMP
- **Uses advantages of both extremes**
- **Difficult to remain consistent within the same application**

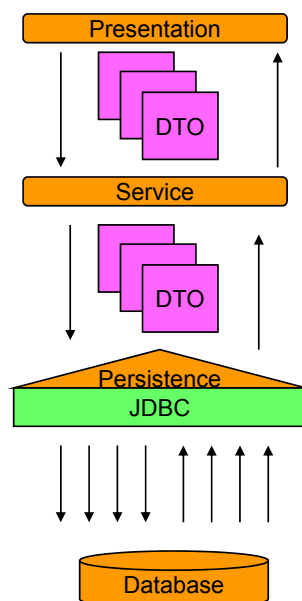

Traditional Persistence

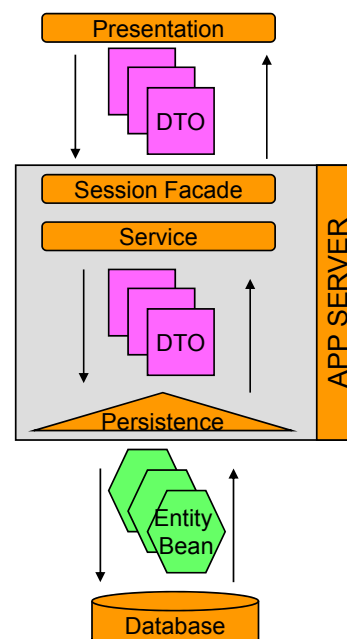

Customized Java EE Training: <http://courses.coreservlets.com/>
 Servlets, JSP, Struts, JSF/MyFaces/Facelets, Ajax, GWT, Spring, Hibernate/JPA, Java 5 & 6.
 Developed and taught by well-known author and developer. At public venues or onsite at *your* location.

Traditional Persistence

Persistence with JDBC

Persistence with EJB 2.x

JDBC Overview

- **JDBC API provides ability to**
 - Establish connection to a database
 - Execute SQL statements
 - Create parameterized queries
 - Iterate through results
 - Manage database transactions
- **Basic Steps to JDBC Operations**
 1. Load driver or obtain datasource
 2. Establish connection using a JDBC URL
 3. Create statement
 4. Execute statement
 5. Optionally, process results in result set
 6. Close database resources
 7. Optionally, commit/rollback transaction

JDBC Example – Create Account

```
public Account createAccount(Account account) {  
  
    Connection connection = null;  
    PreparedStatement getAccountIdStatement = null;  
    PreparedStatement createAccountStatement = null;  
    ResultSet resultSet = null;  
    long accountId=0;  
  
    // Load driver  
    try {  
        Class.forName("oracle.jdbc.driver.OracleDriver");  
    } catch (Exception e) {  
        throw new RuntimeException(e);  
    }  
  
    try {  
        //Get connection and set auto commit to false  
        Connection connection =  
            DriverManager.getConnection("jdbc:oracle:  
                thin:lecture1/lecture1@localhost:1521:XE");  
        connection.setAutoCommit(false);  
  
        ...  
    }  
}
```

JDBC Example – Create Account

```
...

//Get account id from sequence
getAccountIdStatement = connection
    .prepareStatement("SELECT ACCOUNT_ID_SEQ.NEXTVAL
        FROM DUAL");
resultSet = getAccountIdStatement.executeQuery();
resultSet.next();
accountId = resultSet.getLong(1);

//Create the account
createAccountStatement = connection
    .prepareStatement(AccountDAOConstants.CREATE_ACCOUNT);
createAccountStatement.setLong(1, accountId);
createAccountStatement.setString(2,
    account.getAccountType());
createAccountStatement.setDouble(3, account.getBalance());
createAccountStatement.executeUpdate();

//Commit transaction
connection.commit();
}
...
```

JDBC Example – Create Account

```
...

catch (SQLException e) {
    //In case of exception, rollback
    try{
        connection.rollback();
    }catch(SQLException e1){// log error}
    throw new RuntimeException(e);
}
finally {
    //close database resources
    try {
        if (resultSet != null)
            resultSet.close();
        if (getAccountIdStatement != null)
            getAccountIdStatement.close();
        if (createAccountStatement != null)
            createAccountStatement.close();
        if (connection != null)
            connection.close();
    } catch (SQLException e) { // log error}
}
}
```

EJB 2.x Overview

- **EJB API provides ability to**
 - Map object model to database tables
 - Hand off management of database connections
 - Take care of relationship management
 - Manage transactions
 - Use callback methods.
 - Search for desired objects
 - Access Control
- **Basic Steps to EJB Operations**
 1. Create your EJB
 - Home Interface
 - Remote Interface
 - Bean Class (implementation class)
 2. Setup deployment descriptors
 - ejb-jar.xml
 - Container specific EJB descriptor (<container>-ejb-jar.xml)
 3. In code, look up the EJB Home Interface
 4. Create an instance of the EJB off the Home Interface, using attributes passed in through the method call

EJB 2.x Home Interface

```
public interface SavingsAccountHome extends EJBHome {  
  
    public SavingsAccount create(String id, String  
        firstName, String lastName, BigDecimal balance)  
        throws RemoteException, CreateException;  
  
    public SavingsAccount findByPrimaryKey(String id)  
        throws FinderException, RemoteException;  
  
    public Collection findByLastName(String lastName)  
        throws FinderException, RemoteException;  
}
```

EJB 2.x Remote Interface

```
public interface SavingsAccountRemote
    extends EJBObject {

    public void debit(BigDecimal amount)
        throws RemoteException;

    public void credit(BigDecimal amount)
        throws RemoteException;

    public String getFirstName()
        throws RemoteException;

    public String getLastName()
        throws RemoteException;

    public BigDecimal getBalance()
        throws RemoteException;
}
```

Source http://java.sun.com/j2ee/tutorial/1_3-fcs/doc/BMP2.html#62922

EJB 2.x Bean Class

```
public class SavingsAccountBean {

    public String ejbCreate(String id, String firstName,
        String lastName, BigDecimal balance)
        throws CreateException {

        if (balance.signum() == -1) {
            throw new CreateException(
                "A negative initial balance is not allowed."
            );
        }

        this.id = id;
        this.firstName = firstName;
        this.lastName = lastName;
        this.balance = balance;

        return id;
    }
    ...
}
```

Source http://java.sun.com/j2ee/tutorial/1_3-fcs/doc/BMP2.html#62922

EJB 2.x Bean Class

```
...
public void ejbPostCreate() {
    // The ejbPostCreate method must have the same
    // input parameters and return type as the
    // ejbCreate method.
    //
    // If you want to set up a relationship you should
    // do so in the ejbPostCreate method.
}

public void ejbRemove() {}
public void ejbLoad() {}
public void ejbStore() {}

...
```

Source http://java.sun.com/j2ee/tutorial/1_3-fcs/doc/BMP2.html#62922

EJB 2.x Bean Class

```
...
public void debit(BigDecimal amount) {
    balance = balance.subtract(amount);
}

public void credit(BigDecimal amount) {
    balance = balance.add(amount);
}

public String getFirstName() {
    return firstName;
}

public String getLastName() {
    return lastName;
}

public BigDecimal getBalance() {
    return balance;
}

...
```

Source http://java.sun.com/j2ee/tutorial/1_3-fcs/doc/BMP2.html#62922

EJB 2.x ejb-jar.xml

```
<enterprise-beans>
  <entity>
    <description> Savings Account Bean </description>
    <display-name> SavingsAccount </display-name>
    <ejb-name> SavingsAccount </ejb-name>
    <home>example.bean.SavingsAccountHome</home>
    <remote>example.bean.SavingsAccountRemote</remote>
    <ejb-class>example.bean.SavingsAccountBean</ejb-class>
    <persistence-type>Container</persistence-type>

    <cmp-version>1.x</cmp-version>

    <cmp-field><field-name>id</field-name></cmp-field>

    <cmp-field><field-name>firstName</field-name></cmp-field>

    <cmp-field><field-name>lastName</field-name></cmp-field>

    <cmp-field><field-name>balance</field-name></cmp-field>

    <primkey-field>id</primkey-field>
  </entity>
</enterprise-beans>
```

EJB 2.x jonas-ejb-jar.xml

```
<jonas-entity>
  <ejb-name>SavingsAccount</ejb-name>
  <jndi-name>SavingsAccount</jndi-name>
  <jdbc-mapping>
    <jndi-name>jdbc_conn1</jndi-name>
    <jdbc-table-name>SAVINGS_ACCOUNT</jdbc-table-name>

    <cmp-field-jdbc-mapping>
      <field-name>id</field-name>
      <jdbc-field-name>ID</jdbc-field-name>
    </cmp-field-jdbc-mapping>

    <cmp-field-jdbc-mapping>
      <field-name>firstName</field-name>
      <jdbc-field-name>FIRST_NAME</jdbc-field-name>
    </cmp-field-jdbc-mapping>

    <cmp-field-jdbc-mapping>
      <field-name>lastName</field-name>
      <jdbc-field-name>LAST_NAME</jdbc-field-name>
    </cmp-field-jdbc-mapping>
  ...
</jonas-entity>
```

EJB 2.x jonas-ejb-jar.xml

```
...

<cmp-field-jdbc-mapping>
  <field-name>balance</field-name>
  <jdbc-field-name>BALANCE</jdbc-field-name>
</cmp-field-jdbc-mapping>

<finder-method-jdbc-mapping>
  <jonas-method>
    <method-name>findByLastName</method-name>
  </jonas-method>
  <jdbc-where-clause>
    WHERE LAST_NAME = ?
  </jdbc-where-clause>
</finder-method-jdbc-mapping>
</jdbc-mapping>
</jonas-entity>
```

EJB 2.x Client

```
InitialContext context = new InitialContext();
SavingsAccountHome home =
    (SavingsAccountHome)context.getEJBHome();

SavingsAccount john =
    home.create("123", "Doe", "John", zeroAmount);

john.credit(new BigDecimal("88.50"));
john.debit(new BigDecimal("20.25"));
BigDecimal balance = john.getBalance();

Collection c = home.findByLastName("DOE");
```

Traditional Persistence vs. Hibernate

Persistence with Hibernate

32

© 2009 coreservlets.com

Motivation

Customized Java EE Training: <http://courses.coreservlets.com/>

Servlets, JSP, Struts, JSF/MyFaces/Facelets, Ajax, GWT, Spring, Hibernate/JPA, Java 5 & 6.

Developed and taught by well-known author and developer. At public venues or onsite at *your* location.

Hibernate History

- **Grass roots development (2001)**

- Christian Bauer
- Gavin King

- **JBoss later hired lead Hibernate developers (2003)**

- Brought Hibernate under the Java EE specification
- Later officially adopted as the official EJB3.0 persistence implementation for the JBoss application server.

- **EJB 3.0 Expert Group (2004)**

- Key member which helped shape EJB3.0 and JPA

- **NHibernate**

- .NET version release in 2005

Hibernate Goals

- **Prevent leakage of concerns**

- Domain model should only be concerned about modeling the business process, not persistence, transaction management and authorization
- Flaw of EJB2.x

- **Transparent and automated persistence**

- Complete separation of concerns between domain model objects and the persistence mechanism.
- Persistent solution does not involve writing SQL

- **Metadata in XML**

- Object/Relational Mapping should provide human readable mapping format (not just a GUI mapping tool)

- **Reduction in LOC**

- **Importance of domain object model**

Why Hibernate?

- **Impedance mismatch**
 - Object-oriented vs. relational
- **Failure of EJB 2.x**
 - Entity Beans were extremely slow, complex
- **Java developers are not database developers**
 - Reduce the need for developers to know and fully understand database design, SQL, performance tuning
 - Increase portability across database vendors
- **Increase performance by deferring to experts**
 - Potential decrease in database calls
 - More efficient SQL statements
 - Hibernate cache usage

36

Why not Hibernate?

- **Overkill for small number of tables**
- **Complex legacy database schema**
- **Heavy batch processing**
- **Advanced queries / more SQL control**
- **Free, but tied to third party**
- **Complexity / ramp up / support**
- **Scaling concerns (Shards)**
- **Gavin King is somewhat opinionated ☺**

Who Uses Hibernate?

- Ubik-Ingénierie, ubik-ingenierie.com, Roubaix, France
- Fedelta POS, fedeltapos.com, Brisbane, Australia
- Skillserv, skillserv.com, San Francisco, California, USA

Relational Persistence for Java and .NET

Hibernate is a powerful, high performance object/relational persistence and query service. Hibernate lets you develop persistent classes following object-oriented idiom - including association, inheritance, polymorphism, composition, and collections. Hibernate allows you to express queries in its own portable SQL extension (HQL), as well as in native SQL, or with an object-oriented Criteria and Example API.

Unlike many other persistence solutions, Hibernate does not hide the power of SQL from you and guarantees that your investment in relational technology and knowledge is as valid as always. The LGPL open source license allows the use of Hibernate and NHibernate in open source and commercial projects.

Hibernate is a Professional Open Source project and a critical component of the JBoss Enterprise Middleware System (JEMS) suite of products. JBoss, a division of Red Hat, offers a range of 24x7 Professional Support, Consulting, and Training services to assist you with Hibernate.

Quickstart

Hibernate – Step 2

- Select the core binary release

Binary Releases

Package	Version	Release date	Category	
Hibernate Core	3.3.1.GA	11.09.2008	Production	Download

- Select download type

Package	Release	Filename	Size	Architecture
hibernate3				
Latest	3.3.1.GA	(2008-09-11 18:54)		
		hibernate-distribution-3.3.1.GA-dist.tar.gz	28703494	Platform-Independent
		hibernate-distribution-3.3.1.GA-dist.zip	31462800	Platform-Independent
Totals:	1	2	60166294	

Hibernate – Step 3

- **Unzip the Download**

- hibernate-distribution-3.3.1.GA-dist.zip
- Copy jars from locations under root of zip
 - hibernate3.jar
 - hibernate-distribution-3.3.1.GA/lib/required
- Drop the jars from into the lib directory of your project (or other location you can add to your projects classpath)

- **Obtain a Simple Logging Façade for Java (SLF4J) Implementation**

- <http://www.slf4j.org/download.html>
 - slf4j-simple-1.5.3.zip
- Unzip and copy slf4j-simple-1.5.3.jar into lib directory of your project
 - slf4j-simple-1.5.3.jar under root directory of download

Hibernate – Step 4

- **Within Eclipse**

The image shows three screenshots from the Eclipse IDE illustrating the steps to configure the build path for a project named 'Lecture2'.

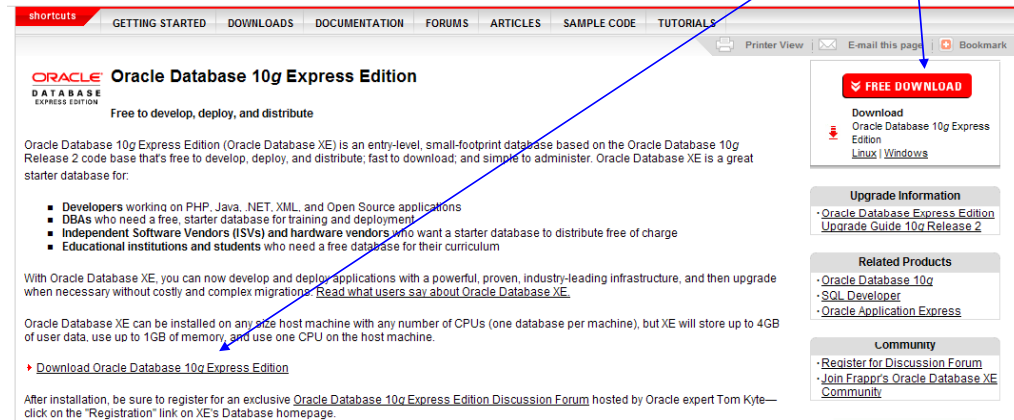

Left Screenshot: A right-click context menu is open over the 'Lecture2' project in the Package Explorer. The 'Configure Build Path...' option is highlighted. A blue arrow points from the text 'Right click on project to get to "Configure Build Path"' to this option.

Middle Screenshot: The 'Properties for Lecture2' dialog box is open, with the 'Libraries' tab selected. The 'Libraries' list contains several JARs. A blue arrow points from the text 'Under the "Libraries" tab, click "Add JARs" to add the Hibernate jars to the project' to the 'Add JARs...' button.

Right Screenshot: The 'JAR Selection' dialog box is open, showing a list of JARs. The 'Lecture2' project is selected in the list. A blue arrow points from the 'Add JARs...' button in the middle screenshot to this dialog.

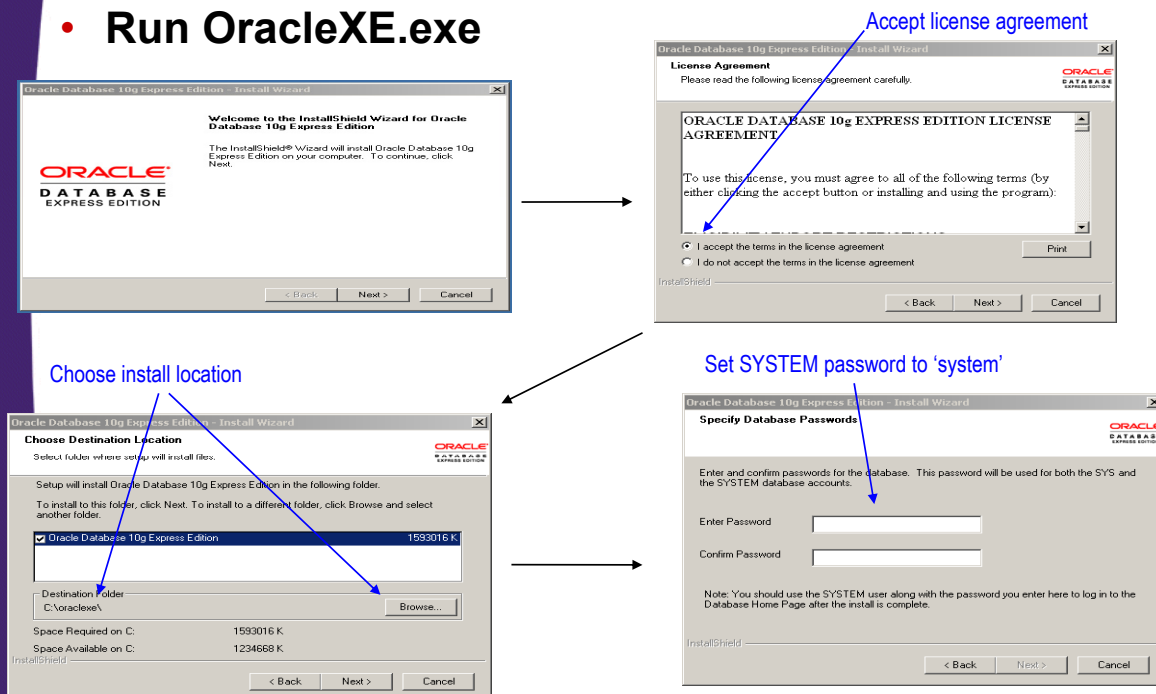

Oracle Express – Step 1

- <http://www.oracle.com/technology/products/database/xe/index.html>
 - Download OracleXE.exe install
 - Also available for Linux
 - Debian, Mandriva, Novell, Red Hat and Ubuntu

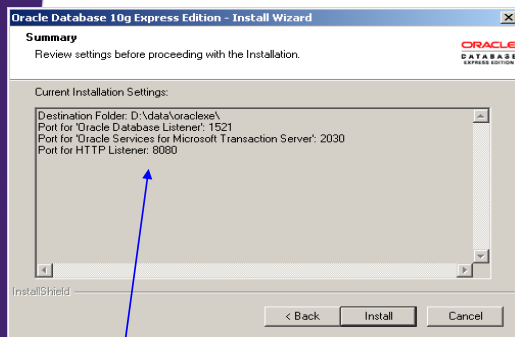

Oracle Express – Step 2

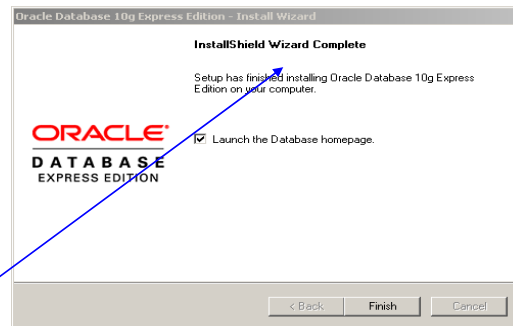

- Run OracleXE.exe

Oracle Express – Step 3

Confirm

Complete

Login and test
<http://127.0.0.1:8080/apex/>

Starting and Stopping Oracle

- Oracle is automatically running upon install
- Start and stop Oracle using the StartDB and StopDb scripts
 - C:\oracle\ee\app\oracle\product\10.2.0\server\BIN\StartDB.bat
 - C:\oracle\ee\app\oracle\product\10.2.0\server\BIN\StopDb.bat
- In Windows, can use Start Menu Options

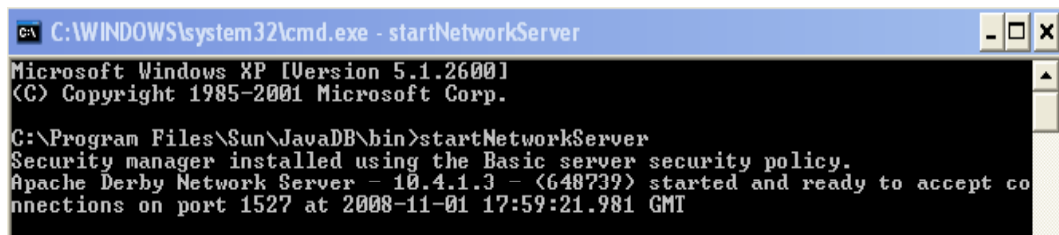

JavaDB Configuration

- **JavaDB is a version of Derby that comes packaged with Java 6**
- **Configuration – set environment variables**
 - DERBY_HOME
 - Value should be location of JavaDB root directory
 - Example: C:\Program Files\Sun\JavaDB
 - PATH
 - Append JavaDB bin directory to existing PATH variable
 - Example: C:\Program Files\Sun\JavaDB\bin

JavaDB Configuration

- **Start Server by calling startNetworkServer script**

```
C:\WINDOWS\system32\cmd.exe - startNetworkServer
Microsoft Windows XP [Version 5.1.2600]
(C) Copyright 1985-2001 Microsoft Corp.

C:\Program Files\Sun\JavaDB\bin>startNetworkServer
Security manager installed using the Basic server security policy.
Apache Derby Network Server - 10.4.1.3 - (648739) started and ready to accept co
nnections on port 1527 at 2008-11-01 17:59:21.981 GMT
```

- **Stop Server by calling stopNetworkServer script (in another window)**

Wrap-up

Customized Java EE Training: <http://courses.coreservlets.com/>
Servlets, JSP, Struts, JSF/MyFaces/Facelets, Ajax, GWT, Spring, Hibernate/JPA, Java 5 & 6.
